Branch Chief

This report has been reviewed by the ESC Public Affairs Office (PA) and is releasable to the National Technical Information Service (NTIS).

Qualified requestors may obtain additional copies from the Defense Technical Information Center (DTIC). All others should apply to the National Technical Information Services (NTIS).

If your address has changed, if you wish to be removed from the mailing list, or if the addressee is no longer employed by your organization, please notify AFRL/VSIP, 29 Randolph Road, Hanscom AFB, MA 01731-3010. This will assist us in maintaining a current mailing list.

Do not return copies of this report unless contractual obligations or notices on a specific document requires that it be returned.

REPORT DOCUMENTATION PAGE		Form Approved OMB NO. 0704.0188	
Public reporting burden for this collection of information is estimated to average 1 hour per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Send comments regarding this burden estimate or any other aspect of the collection of information, including suggestions for reducing this burden, to Washington Headquarters Services, Directorate for Information Operations and Reports, 1215 Jefferson Davis Highway, suite 1204, Arlington, VA 22202-4302, and to the Office of Management and Budget, Paperwork Reduction Project (0704-0188), Washington, DC 20503.

ABSTRACT (Maximum 200 words) The CSIMPS effort extends the work of the IMPS asteroid albedo and diameter determination by increasing the number of asteroids sampled. The IMPS processing effort was performed on 486 computer systems and was limited by disk size and memory. The CSIMPS effort removed these limitations and took advantage of more efficient processing. This report documents the software used to determine the asteroid albedos and diameters in CSIMPS.

1 Background

1.1 Historical Notes On IMPS

The primary goal of IMPS was to obtain derived information concerning asteroids with reliable orbital elements. From a database of probable sightings extracted from IRAS data, the orbital elements of a known asteroid can be used to find IRAS sightings of that asteroid. Together with prior observations of the asteroid's absolute magnitude, slope parameters, and UBV colors, the asteroid's albedo and diameter can be derived from the IR flux of the IRAS sighting. Supplementary derived information, including quality metrics, both enhance the scientific value of these derived parameters and are useful for evaluating the completeness and accuracy of the data reduction routines.

In the original IMPS implementation, the system processed two databases: 1) the probable sightings extracted from IRAS database (IP01) and 2) the known asteroid orbital elements database (IP02).

The IP02 database contained 4,679 numbered and 2,632 unnumbered asteroids. For each asteroid, the file specified the osculating orbital elements for each of three epochs in 1983; the UBV color indices, the absolute magnitudes and the geometric albedo. These values were compiled from many locations, mostly from ground observations.

The IP01 database contains about 2.7 million probable sightings extracted from the IRAS Survey data during the confirmation strategy processing phase. The confirmation strategy separated IR sources into three basic categories: fixed sources, non-astronomical sources such as energetic particle hits and fast-moving debris, and moving sources such as asteroids and comets. The processing involved comparing detections in two contiguous detectors of a single scan, in two or more orbits within a 36-hour period, and scans taken several weeks apart. This processing was limited to some extent by background regions where a moving source's short wave signature could be lost in the structured signatures of the galactic center, or the Magellanic clouds, or the source's long wave signature could be lost in the celestial cirrus. Thus, these sightings do not represent a uniform spatial sampling of the whole sky. Nonetheless, these IRAS survey observations, which began February 9, 1983 and ended November 22, 1983, remain the most complete IR survey of asteroid properties made to date. While some IRAS data is still being reprocessed for new calibration information, etc., the IP01 database is said to be the final probable sightings database that will be extracted from the IRAS data.

1.2 SIMPS, the Second IMPS and CSIMPS, the C version of SIMPS

Astronomers at the AFRL realized that the IRAS IP01 database was a unique, irreproducible, and extremely valuable product, and that as new asteroids were identified, their diameters and albedos might be derivable by associating them with IP01 sightings. To provide a software solution, SIMPS, the Second IMPS, was created. SIMPS, which was partly written in PASCAL, was rewritten in C++ to accommodate newer compilers and architectures.

The input database files IP01 and IP02 were changed a little for SIMPS. The IP01 file became the IP01A file, which had refined record values, but maintained most of the original file

format. The IP01A parameters are listed in Table 2. There is a one-to-one correspondence between IP01A parameters and IP01 parameters provided in Table B-2 of IPAC's "IRAS Asteroid and Comet Survey" (October 1986) edited by Dennis Matson. However, some of the parameters are ordered differently in the record.

The IP02 file was replaced by the IP03 file. In SIMPS, and CSIMPS, this file is generated by a new process GENIP03. GENIP03 takes a new set of text files: ELEMS\ETelem1.DAT, ELEMS\ETelem2.DAT, ELEMS\ETelem3.DAT, and ELEMS\ET_ADD.DAT, as input values and creates the binary IP03 database. The IP03 parameters are presented in Table A-2.

1.2.1 SIMPS Processing

In this code, all of the processing was accomplished on PC's. Conceptually, the code is divided into three separate processors, as defined in "Chapter 4: IRAS Asteroid Data Processing" of the IMPS Minor Planet Survey. These separate processors are the AK processor (known asteroids), the AD processor (the derived information), and the FP processor (the final product generation).

In SIMPS, there were seven FORTRAN codes and 43 PASCAL codes. Three of the FORTRAN codes (AKM.FOR, GENAK04.FOR, and GENAK09.FOR) were responsible for much of the former known asteroid (AK) processing; the remaining were the thermal model codes and time/log utilities. These codes run sequentially, taking some outputs of the previous codes as inputs. Collectively, the files AK.Log, AK01, AK01Indx, AK02, AK13, AK04, IPUD, and AK09 are created by the FORTRAN routines. The PASCAL codes GENAK06, GENAK05, GENAK10, and Add2AK10 created and modified AK06, AK07, AK05, and AK10, based on the previous files and system files from IPAC.

PASCAL codes performed the asteroid derived (AD) processing and the final product (FP) processing. These processors were not fully de-coupled; some of the AD processing programs set flags and fields in the AK file output. Efforts have been made to make separate packages in the CSIMPS implementation.

The LIMISS code creates the AD06 file and updates the AK10 file in the following ways: 1) if (AK10Rec.AlbMst == 0.0) AK10Rec.AlbMst = 0.01, and 2) AK10Rec.PStatW = (AK10Rec.PStatW | 1024), sets bit 10. The ADLBH code creates the AD02 file. The GENFP01 process, which generates an FP01 file with all records initialized to 0s, must be run prior to FPARD, which populates the FP01 file with values and updates AD02's ADStat word, and AK05's AstatW word. The IMPSUT01 code updates the AstatW word in AK05 and the PstatW word in AK10. The IMPSUT01 code updates the PstatW word in AK10.

There are 10 PASCAL codes that independently take the AK and AD outputs to produce final products. The programs GENAD07 and GENAD04 produce the AD07 and AD04 text files of asteroid derived parameters. The programs GENAK11 produces the AK11 text file, which is the only AK file not used in any subsequent processing. The programs GENFP20, GENFP21, GENFP102, GENFP105, and GENFP108 create the set of FP final products described in the IMPS Minor Planet Survey.

1.2.2 CSIMPS

The fact that AK, AD, and AP processes all affected output associated with AK database files, and the fact that one of the static database inputs is preprocessed, made the system organization very intertwined, and the conversion to C++ code was more complex than it needed to be.

The output files, with one or two exceptions are the same format for CSIMPS as for SIMPS. In order to be able to process more known asteroid ID numbers, some fields in some records needed to be changed from a short (2-byte) integer to a long (4-byte) integer. This necessarily made otherwise identical file records different.

2 AK Processing

The AK Processing involves the sequential running of several programs. In SIMPS, all processing was rolled into one batch file that took hours to run. In CSIMPS, the AK processing programs have been modularized into the batch file AK_proc.bat. In SIMPS, all output files had no extensions and were written to the main directory. In CSIMPS, AK processing outputs are written to the AK_database subdirectory. Text files have the ".txt" extension and binary files have a ".bin" extension (Tables 1 & 2). The CSIMPS file nomenclature is used in describing the files that are in both systems.

Table 1. The AK Processing Output Files of the Associated Sightings

Filename	Description
AK01.bin	Sightings associated with known asteroids. Predicted sightings are derived from the IP03 asteroid elements. The IP01A file is searched for possible associations.
AK13.txt	"Disconnected" asteroids. A record is written whenever an asteroid is associated with a sighting that has previously been associated with a different asteroid.
AK04.txt	Sightings associated with known asteroids. This file has the same sightings as the AK01 file, and includes additional descriptors.
AK06.bin	For each asteroid, there is a record holding pointers to all the associated sightings, and pointers to all the missed predicted sightings.
AK05.bin	Sightings associated with known asteroids.

Table 2. The AK Processing Output Files of the Missed Predictions

Filename	Description
AK02.bin	Missed predicted sightings. Predicted sightings are derived from the IP03 asteroid elements. The IP01A file is searched for possible associations. Reference PL-TR-92-2049, "The IRAS Minor Planet Survey" Chapter 4, page 28 and 36: Predicted sightings that were not realized were recorded in AK02; this included sightings that were actually impossible because, for example, the source was too faint or the image crossed dead detectors, etc.
AK09.txt	Missed predicted sightings file.
AK06.bin	For each asteroid, there is a record holding pointers to all the associated sightings, and pointers to all the missed predicted sightings. These pointers reference data in AK10.bin.
AK10.bin	Missed predicted sightings file.
AK11.txt	Missed predicted sightings file.

When analyzing the overall flow of the SIMPS suite, we find that there are basically two streams of processing. First, the AKM program classifies IRAS sightings as either associated or disconnected, and classifies predicted sightings as either associated or missed. From there, the associated sightings and the missed predictions are processed separately.

The associated sightings are originally written to the AK01.bin file, then rewritten with some additional parameters from IP01A and IP03 to the AK04.txt file, and then AK04.txt parameters are rewritten with only a "fix" made to phase angle, to the AK05.bin file. The AK05.bin file is read for deriving albedos and diameters in the AD processing, and for getting sighting information during final product (FP) generation. Only the Asteroid Status Word is updated in subsequent processing. The conversion from binary to text to binary is a possible source of truncation error.

The missed predictions are originally written to the AK02.bin file, then rewritten to the AK09.txt file with an additional Prediction Status Word, and then rewritten to the AK10.bin file, and finally after some unit and coordinate conversions are rewritten again to the AK11.txt file. Once again, the conversion from binary to text to binary to text is a possible source of truncation error.

2.1 The AKM.EXE Program

Each object in the IP03 data set of known asteroids is processed by the AKM.EXE program to search for matching IRAS sightings in the IP01A data set. The IP01A file, which houses all probable sightings for the entire IRAS mission, is searched for each object.

Processing for each object includes:

- 1) Compute the geometrical coincidence of the object's trajectory with that of the scanning telescope.
- 2) Using the coincidence times, check for actual sightings occurring sufficiently close in time and position.

This resulted in a list of possible detections for each object. Typically, there are about eight possible sightings; most asteroids had between two and twenty sightings. These sightings are further analyzed to accept as an association or to discard on the basis of a second position agreement test and a flux ratio test. These test results are combined into a single score, and the score is thresholded to determine whether or not an association can be made. When no associations are made for an asteroid's predicted sighting, a "missed prediction record" is written to AK02.bin. Table 3 lists the data files used with AKM.

Table 3. The input and output files associated with the main program AKM.

Input File	Output Files
AstatW23	Appended Ranges.Dat
Kapnam	AK13.bin

lpac\aacv	
lpac\aacvindx	
lpac\XYZSun	
IP03.bin	
lp01a.loc -> ip01andx ip01a	
lp_data\ip01a.stw	

Between CSIMPS and SIMPS, the only variable in the AK01.bin that has different values is "SCORE" the IRAS Match Decision Parameter. The score values are always higher in the CSIMPS version, and more asteroid sighting records (over 600) are reported as a result of score values exceeding the threshold. The differences arise from either differences in FORTRAN compilers, or perhaps the original EXE file that was delivered to MRC was not produced from the corresponding FORTRAN source that was delivered to MRC.

A sighting record from the IP01A file is associated with one and only one asteroid from the IP03 file. According to the documentation, when an association is made, the AK01 file is searched for conflicting matches, and the best match is kept. When one sighting is initially associated with two asteroids, their flux values and IRAS match decision parameters are

evaluated to determine which asteroid the sighting will be associated with. The best match is determined on the basis of passing the flux test and having the highest position score. When a sighting is discarded on the basis that it has been associated with a different asteroid, a record is written to the AK13 text file. As a result, this file includes both 'disconnected asteroids' and asteroids that were never detected.

In reality, however, the code always keeps the first sighting it finds, and just writes to the AK13 text file. There were 18 asteroid sightings in the AK05.bin file that had the AstatW bit 30 set, indicating that there were two or more asteroids matching that sighting. This behavior was preserved in the CSIMPS version, although we will state that when a sighting is found to match a second asteroid, the first asteroid wins on the basis of Asteroid ID number (its rank in the IP03 file), and not on flux or position scores, even though they might be computed. The AK13 file is used in only one post-process, the Add2AK10 program detailed below. In CSIMPS, The AK13 file is named "AK13.txt" and output to the "AK_database" subdirectory. After running Add2AK10, there were 78 asteroid sightings in the AK05.bin file that had the AstatW bit 30 set, indicating that there were two or more asteroids matching that sighting. As noted below, this process sets the bit to true for all the sightings in the AK13 file

The outcome of AKM processing is that all sightings in the IP01A file are classified as 1) an associated sighting (matching the predicted location/flux of known asteroid in IP03); 2) a disconnected sighting matching two asteroids; 3) a discarded sighting. Associated sightings are written to the AK01 file. Disconnected sightings are written to the AK13 file. Discarded sightings are ignored in subsequent processing.

2.2 The GENAK04.EXE Program

The GENAK04 program reads each associated sighting record in AK01 binary file and produces a record in the AK04 text file. Using the pointer information to access the probable sightings record in the IP01A file, the GENAK04 program adds to the associated sightings file the following information from the IP01A file:

1. Earth-centered observed IRAS position
2. (Y, Z) position uncertainty parameters
3. (Y, Z) position uncertainty parameters
4. (Y, Z) position uncertainty parameters
5. Observed flux (in each of the 4 IRAS bands)
6. Observed flux uncertainty (in each of the 4 IRAS bands)
7. Observed flux signal-to-noise-ratio array
8. Predicted Tnam
9. Asteroid status word.
10. Confusion status words
11. Correlation coefficients
12. Flux status word for observed fluxes

13. Detector ID arrays

14. Predicted DETID

The process also reads the IP03 records for the known asteroid of the sighting, to acquire the following:

1. Absolute visual magnitude
2. Phase-coeff-like parameter
3. IP03 albedo estimate
4. H quality code
5. Ephemeris Reliability code
6. Asteroid Name

Table 4 lists the data files used with GENAK04.

Table 4. The input and output files associated with the GENAK04 program.

Input File	Output Files
IP03.bin	AK04.bin
Ipac\PSCRej	IP01UD
Ipac\SSCVer1	
Ipac\SSCVer2	
Ipac\FSCVer1	
Ipac\SerVer1

AK01.bin	
Ip01a.loc -> ip01andx ip01a	
Ip_data\ip01a.stw	

Various flags in the Asteroid Status Word are set on the basis of the sighting having records in other IPAC files:

IPAC\PSCRej
IPAC\SSCVer1
IPAC\SSCVer2
IPAC\FSCVer1
IPAC\SerVer1
IPAC\AstatW23

2.3 The GENAK09.EXE Program

The GENAK09 program reads each missed sighting record in AK02.bin file and produces a record in the AK09.txt file. Each record is just a text version of the AK02.bin file, with one additional variable "PSTATW" appended at the end. Table 5 lists the data files used with GENAK09.

Table 5. The input and output files associated with the GENAK09 program.

Input File	Output Files
AstatW23.sav	AK09.txt
AK02.bin	

2.4 The GENAK06.EXE Program

The GENAK06 reads the RANGES.DAT text file generated by the pre-processor GENIP03.EXE and creates AK06.bin and AK07.bin files with records for each asteroid in the IP03.bin data set. Each record is a fixed array of 75 unsigned short values, each acting as a pointer into the binary file of associated sightings (AK05) and the binary file of missed sightings (AK10). Each value in each record is initialized to 0.0. AK06.bin holds the pointers for Type 1 asteroids, and is used throughout the rest of the processing. For the current implementation, the AK07.bin file, which holds the Type 2 asteroid pointers, is irrelevant because only Type 1 asteroids are processed. Some of the references to AK07.bin have therefore been removed from this documentation even though the programs may in fact require its existence or have the algorithms to access or update the AK07.bin file if a Type 2 asteroid is found. Table 6 lists the data files used with GENAK06.

Table 6. The input and output files associated with the GENAK06 program.

Input File	Output Files
Ranges.Dat	AK06.bin
	AK07.bin

2.5 The GENAK05.EXE Program

The GENAK05 reads the RANGES.DAT text file generated by the pre-processor, and for each associated sighting record in the AK04.txt file, an associated sighting record is generated in the AK05.bin file. For each record, a pointer to that record is set in the record number corresponding to the known asteroid number in AK06.bin. The only processing that takes place is a fix to the phase angle stored in variable PrdAlp. The flow of the AK processing is somewhat flawed in that what started as a binary AK01.bin, IP03.bin, or IP01A file parameter value, became a truncated AK04.txt parameter value, and is now being stored as an AK05.bin parameter value. The only processing that has taken place is the "FixPhase" which changes the phase angle value originally set in AK01.bin. Table 7 lists the data files used with GENAK05.

Table 7. The input and output files associated with the GENAK05 program.

Input File	Output Files
Ranges.Dat	AK05.bin
AK04.txt	AK06.bin (updated)
AK06.bin	GenAK06.Log

2.6 The GENAK10.EXE Program

The GENAK10 program reads the RANGES.DAT text file generated by the pre-processor, and for each missed sightings record in the AK09 text file, a missed sightings record is generated in the AK10 binary file. For each record, a pointer to that record is set in the record number corresponding to the known asteroid number in AK06 (if it is a type 1 asteroid) and in AK07 (if it is not a type 1 asteroid). Note that no records are set in AK07, although the file is generated, because only type 1 asteroids are allowed by the program. Table 8 lists the data files used with GENAK10.

Table 8. The input and output files associated with the GENAK10 program.

Input File	Output Files
Ranges.Dat	AK10.bin
IP03.bin	AK06.bin (updated)
AK06.bin	GenAk10.Log
AK09.txt	AK10Size.0

2.7 The Add2AK10.EXE Program

The Add2AK10 program documentation says that it is appending records to the missed sightings file AK10 on the basis of disconnected sightings written to the AK13 file. However, that is not the case, and parts of the code that appear to have perhaps once done that are commented out. What the program does, is read in sequence each record (line) of the AK13.txt file, and for the kept asteroid ID, it loops through all the sightings pointers in AK06.bin to find the associated sightings records in AK05.bin, and if the Prediction Time (Tnam) is a match, it sets bit 29 (29 if you start counting from 0, 30 if you start counting from 1) in the AstatW status word of that record to true. For the asteroid ID of the second match in AK13.txt, the asteroid which lost the race to having that sighting associated with it, the program loops through all the missed sightings pointers in the AK06.bin file and find the associated missed sightings in the AK10.bin file, and if the Prediction Time (Tnam) is a match, it sets bit 15 in the PstatW status word. The program proceeds to claim to have added records to the end of AK10.bin. Table 9 lists the data files used with Add2AK10.

Table 9. The input and output files associated with the Add2AK10 program.

Input File	Output Files
Ak13.txt	AK10.bin (updated)
AK05.bin	AK05.bin (updated)
AK10.bin	Add2AK10_Log.txt
AK06.bin	
IP03.bin	
lpac\IP04	
lpac\AK08	

2.8 The StatStat Program

The StatStat program simply creates a statistics file about the AK05.bin associated sightings file. The output file is automatically written to printer port "LPT1" in SIMPS. It has been renamed to "AStatW_Stat.txt" in CSIMPS. The file is a summary of the total number of sightings in the AK05.bin file that have bit n set for all 32 bits of the AStatW status word. This shows the Asteroid Status Word statistics of the AK05.bin file after its initial creation from GenAK05.exe. Note that in bit 30, there are 18 associated sightings which have two or more asteroids passing the score threshold. This number is incremented after running the Add2AK10 program, which loops through the AK13.txt file of 'disconnected sightings'. Table 10 lists the data files used with StatStat. Table 11 is sample output of StatStat. Table 12 describes the Asteroid Status Word.

Table 10. The input and output files associated with the StatStat program.

26	25 micron High Density
27	60 micron High Density
28	100 micron High Density
29	Always Zero
30	2+ known asteroid match
31	2+ sightings match
32	Always Zero

2.9 The IMPSUT01 Program

The purpose of IMPSUT01 is to update the AK05.bin AstatW by setting bit 10 (LSB 0) if predicted flux is less than the FluxMin. It also updates the AK10.bin PstatW by setting bit 11 (LSB 0) if predicted flux is less than the FluxMin. The flux comparison uses only the IRAS band 2 predicted flux. The threshold, FluxMin, is hardwired to 0.14 Jansky and converted to W/m² for processing via FluxMin/1.938e13. This program sets bit 12 in PstatW if there is at least one accepted sighting; and sets bit 13 in PstatW if there is at least one rejected sighting. The documentation says that this is done; however the SIMPS PASCAL code had those lines commented out. The CSIMPS program currently has those lines commented out as well to duplicate the SIMPS processing. Table 13 lists the data files used with IMPSUT01.

Table 13. The input and output files associated with the IMPSUT01 program.

Input File	Output Files
Ranges.Dat	AK05.bin (updated)
IP03.bin	AK10.bin (updated)
AK06.bin	
AK05.bin	
AK10.bin	

2.10 The IMPSUT02 Program

This program sets the PstatW bits 8, 9, 14, and 16 in AK10. Bit 8 (LSB 0) is set when the sighting is "PassedOverDead." This is true when PassedOverDead(AK10.AscMst), where AK10.XScMst is the Predicted X-Scan F/P coordinate, is true where PassedOverDead is defined as:

```
boolean PassedOverDead(Single X)
{
    boolean PassedOverDead_result;
    PassedOverDead_result = (X > -1.9158e-3) && (X < 6.69e-4);
    return PassedOverDead_result;
} /*PassedOverDead*/
```

Bit 9 (LSB 0) is set with the sighting "PassedOverNoisy." This is true when PassedOverNoisy(AK10.AscMst), where AK10.XScMst is the Predicted X-Scan F/P coordinate, is true where PassedOverNoisy is defined as:

```
boolean PassedOverNoisy(Single X)
{
    boolean PassedOverNoisy_result;
    PassedOverNoisy_result = (X < -2.4475e-3) ||
        ((X > 2.4475e-3) && (X < 3.7856e-3));
    return PassedOverNoisy_result;
} /*PassedOverNoisy*/
```

Bit 14 (LSB 0) is set when the Last2SOPs(AK10.TMst), where AK10.TMst is the predicted Tnam (time in deciseconds since IRAS launch) is true where Last2SOPs is defined as:

```
boolean Last2SOPs(longint T)
{
    boolean Last2SOPs_result;
    Last2SOPs_result = (T >= 910966350);
    return Last2SOPs_result;
} /*Last2SOPs*/
```

Bit 16 (LSB 0) is set when the Last2SOPs(AK10.TMst), is true for all pointers.

Table 14 lists the data files used with IMPSUT02.

Table 14. The input and output files associated with the IMPSUT02 program.

Input File	Output Files
Ranges.Dat	AK10.bin (updated)
AK06.bin	
AK10.bin	

2.11 The GENAK11 Program

The AK11.txt file is a file that describes missed predicted sightings. Essentially, it is a text version of the AK10.bin file, with unit conversions and locations in ecliptic and galactic coordinate systems. For each missed predicted sighting, if any of the AK05.bin associated sightings for the asteroid had bits 1-4 (LSB 1) set, then that predicted sighting was ignored and not rewritten to AK11.bin. The AK11.txt file is a final product in the sense that it is not used as an input to subsequent processes and it is in a text format. Table 15 lists the data files used with GENAK11.

Table 15. The input and output files associated with the GENAK11 program.

Input File	Output Files
AK05.bin	AK11.txt
AK06.bin	
AK10.bin	
AK10Size.0	

3 AD Processing

3.1 AD File Output

The AD files give the computed or averaged asteroid albedos and diameters for all of the sightings arranged by group. Table 16 lists the output files associated with the AD processing.

Table 16. The AD Processing Output Files.

File	Description
AD06.bin	Computed albedos and diameter for each missed sighting in AK10.bin.
AD02.bin	Computed albedos and diameter for each associated sighting in AK05.bin.
FP01A.bin	Averaged albedos and diameters for all accepted sightings for each asteroid.
AD07.txt	Computed albedos and diameter for each missed sighting.
AD04.txt	Computed albedos and diameter for each associated sighting.

3.2 The LiMiss Program

The LiMiss program creates the AD06.bin file, a file describing the albedos and diameters of asteroids with missed sightings. According to the documentation in the code, it uses the ADLBH technique to get albedo and diameter from the standard B2 zodiacal noise; then generate fluxes in bands 1, 3, & 4 from the Lebofsky Table. Since the AK10.bin file houses missed sightings, and the flux information from the IP03.bin file, the output in AD06.bin is not based on the IP01A or IRAS sightings data directly, but does use the IPAC thermal model to generate fluxes in the IRAS bands.

The program proceeds to process each missed sighting record in the AK10.bin file. For each missed sighting record, a record is written to the AD06.bin file describing the predicted/modeled flux values and diameter for that missed sighting. The AK10.bin file is also updated. First, if the albedo is 0.0, it is reset to 0.01. Second, if the thermal model iterates beyond the maximum allowed threshold for iterations, the PstatW status word bit 10 is set.

3.3 The ADLBH Program

The ADLBH program creates the AD02.bin file, a file of derived parameters of the AK05.bin associated sightings. This program implements the LBH algorithm to solve for the albedo and radius of each known asteroid.

3.4 The GenFP01 Program

The GENFP01 program creates the FP01A binary file, with all record values initialized to 0.0. Although the file is prefixed "FP" for Final Product, the file should really be regarded as an "AD" file for derived parameters because it has the derived albedo and diameter information, and because it is a binary file.

3.5 The FPARD Program

The FPARD program averages the AD02.bin derived albedo and radius values for all sightings of an asteroid ID. Sightings are excluded if any of the following AstatW bits are set in the AK05 record describing that sighting: bits 4 8 9 16 19 30 (when counting from 0 to 31) which are 5, 9, 10, 17, 20, and 31 (when counting from 1 to 32). Table 15 lists the data files used with FPARD.

Table 17. The input and output files associated with the FPARD program.

Bit	Description
5	WSDB MCON position match
9	Point Source Ver. 2 Match
10	Outer Slot Detection Only
17	Faint Source Ver. 2 match
20	Serendipitous Ver. 1 Match
31	2+ sightings match (set if more than one source is associated with a single asteroid prediction)

Note that bit 30, set if two or more asteroids have a predicted sighting that matches the IRAS sighting, is not used to exclude sightings. Thus, the processing for comparison of IRAS match detection, creation of the AK13.txt file, and the output of the Add2AK10 program is not used in the averaging process for derived albedo and diameter!

Bit 1 and Bit 5 are set in the AD02.ADStat Status Word for each IRAS band.

3.6 The GENAD07 Program

The GENAD07 program produces the AD07.txt file describing the computed albedo and diameter for each missed predicted sighting.

3.7 The GENAD04 Program

The GENAD04 program produces the AD04.txt file, describing the derived albedos and diameter for each associated sighting.

3.8 Analysis of CSIMPS Output: The AK13 File

In both SIMPS and CSIMPS, there are 71 "disconnected asteroid" records (Figure 1). As mentioned before, while the documentation states that a best match is kept, the program is written to accept the first sighting it gets, and just write a record to the AK13.txt file about the second asteroid having a score to qualify it as an associated sighting.

Figure 1. The scatter between asteroid ID of the kept sighting and asteroid ID of the presumed disconnected sighting. In all cases the first ID is smaller.

In both versions, there are 18 sightings in which the score value of the second asteroid was higher than the score value of the first asteroid. The fact that only 18 sightings of 71 actually had a higher score may arise from the correlation between asteroid ID and score value (Figures 2 & 3). There did not seem to be a correlation between score and "Tnam," the time of the sighting. Collectively, this suggests that the lowered numbered asteroids had better osculating element/flux inputs than the higher numbered asteroids, and that if in fact a match was found, it was very likely to be a true association. Since the program processed asteroids sequentially from low number to high number, assigning sightings as it went, it may be that the inherent logic was sufficient for determining disconnected asteroids. Where score values were in fact higher for the second asteroid, the score values were both on the lower side of average acceptable scores. Figure 4 shows the score values.

Figure 2. The IRAS Match Parameters Score as a function of asteroid ID number.

Figure 3. The IRAS Match Parameters Score as a function of asteroid ID number for the disconnected asteroid records.

Figure 4. Score of the disconnected asteroids as a function of the Score of the asteroid kept.

4 IP File Formats

This section describes the IP Processing Input File Formats (Inputs for SIMPS and CSIMPS). The IP01A file is a modified version of the IRAS data set. The IP Processing flow is depicted in Figure 5.

Figure 5. Flow of IP Processing.

This is a 416,939,496 byte file that is pointed to by the path and name specified in the IP01A.LOC file. This way, the file can be kept on a CD-ROM or other archival media, and not on the system disk with CSIMPS. This file is used by the AKM and GENAK04 (both FORTRAN) codes. The parameters in a single IP01A record are described in Table 18.

The IP03.bin file has the osculating elements for all known asteroids to be processed. The file is created by the pre-process GENIP03 which takes the ETELEM1.DAT, ETELEM2.DAT, ETELEM3.DAT, and ET_ADD.DAT text files and creates a single record for each known asteroid. The parameters in a single IP03.bin record are described in Table 19. IP03.bin is used by Add2ak10, Genad04, Genak10, Genfp102, Genfp106, Genfp108, and IMPSUt01. There are 17465 records, each 132 bytes, for a filesize of 2,375,240 bytes.

Table 18. SIMPS and CSIMPS Input File IP01A Parameters.

Parameter	Description	Size	Units
IPLAM	B1950.0 mean ecliptic longitude (spacecraft-centered)	R4	Radians
IPBET	B1950.0 mean ecliptic longitude (spacecraft-centered)	R4	Radians
IPGAM	B1950.0 mean ecliptic twist angle (spacecraft-centered) third Euler angle for transforming from B1950.0 mean ecliptic coordinates to focal-plane coordinates centered on the sighting with the orientation about the line-of-sight equal to that in effect when the source was scanned.	R4	
IPSGY	Gaussian in-scan position uncertainty.	R4	
IPLZ	Uniform cross-scan position uncertainty.	R4	
IPSGZ	Gaussian cross-scan position uncertainty.	R4	
IPRA	B1950.0 mean equatorial right ascension (spacecraft- centered)	R4	
IPDEC	B1950.0 mean equatorial declination (spacecraft-centered)	R4	
IPGAC	B1950.0 mean equatorial twist angle (spacecraft-centered)	R4	
IPANG	Solar Elongation	R4	
IPFLUX[4]	Flux in the four IRAS survey bands.	R4	
IPSGF[4]	Log-Gaussian uncertainties in IPFLX	R4	
IPTNAM	Detection time in deciseconds past 1981.0	I4	
IPDET	Primary Detector ID	I4	
IPDTS[4]	Dectector ID array (packed in-band detector numbers)	I4	
IPFST	Flux status array (packed codes for confirmation/detection status)	I4	
IPCST	Confusion Status Word	I4	
SDASIK (ASTID)	Numbered asteroid association found by SDAS	I4	
INNSOP	SOP (spacecraft operations plan) number	I2	
INNOBS	OBS number	I2	
IP01S1	Spare	I4	
BINNUM	Position bin number	I4	
IPSNR[4]	Signal-to-noise ratio in each survey band.	R4	
IPBL1	Detector baseline in the 10 micron channel.	R4	
IPBL2	Detector baseline in the 20 micron channel.	R4	
IPCOR	Correlation coefficient array (packed)	I4	
ASTATW	Status Word.	I4	

Table 19. IP03.bin Parameters.

Variable	Description	Units	Format
EPnUT[n]	perihelion passage time (UTCS) (input JD in f13.5) converted to UTSC via: $y = 86400.0 * (x - 2444605.5) - 52.96$	UTCS sec	Double[3]
APn[n]	argument of perihelion input degrees (f12.7) converted to radians via: $APn = 1.745329252e-2 * APn$	Radians	Float[3]
LAn[n]	longitude of ascending node input degrees (f12.7) converted to radians via: $LAn = 1.745329252e-2 * LAn$	Radians	Float[3]
Incl[n]	inclination input degrees (f12.7) converted to radians via: $Incl = 1.745329252e-2 * Incl$	Radians	Float[3]
En[n]	Eccentricity (f12.9, but last 2 digits are all zeros)	unitless	Float[3]
PDnKm[n]	perihelion distance in AU (f12.9 but last 2 digits are all zeros so really 10.7) converted to km via: $PDnKm = 149597870.66 * PDnKm$	km	Float[3]
H	absolute visual magnitude (f5.2)	mag	float
G	phase-coefficient-like parameter (f5.2) (usually it is 0.15)	None	float
D	diameter (km) (f5.1)	km	float
Alb	ADAS albedo (f5.3) (usually it is "0.01")	None	float
Ipln	planet code for planet set included in orbit perturbations	None	unsigned char
HQ	H quality code	None	unsigned char
ERC	ephemeris reliability code (always = 1)	None	unsigned char
IRAS1	IRAS ADAS FP04 code; 1 --> included	None	unsigned char
CSC	class source code	None	unsigned char
Name[16]	object name	None	Char*16
class_[6]	object class	None	Char*6
PrvDsg[9]	provisional designation (is the first 9 characters of Name)	None	Char*9

5 AK Processing Output File Formats For Associated Sightings

Tables 20 through 26 list the output formats associated with the AK Associated Sightings file.

Note: Between CSIMPS and SIMPS, the only variable that has different values is "SCORE" the IRAS Match Decision Parameter. The score values are always higher in the CSIMPS version, and more asteroid sighting records (over 600) are reported as a result of score values exceeding the threshold.

In the AKM processing, a sighting record from the IP01A file is associated with one and only one asteroid from the IP03 file. When one sighting is initially associated with two asteroids, their flux values and IRAS match decision parameters are evaluated to determine which asteroid the sighting will be associated with (Table 21).

Interpretation of the first three lines of the AK13 file:

```
700439281 864 1 3.032E+06 1217 1 1.163E+06
820890962 1222 1 1.029E+07 1551 1 9.780E+05
820952790 1222 1 1.156E+07 1551 1 2.957E+05
```

As it turns out, AK.LOG file, indicates that the asteroid of the first line, Asteroid ID 1217, was never detected. The Sighting at TNAM = 700439281 was previously associated with asteroid 864, and that previous value was preserved since it had a higher IRAS match decision parameter.

The second and third lines represent a "disconnected asteroid." Here Asteroid ID 1551 was detected according to the AK.LOG file; however, these two sightings coincide with Asteroid ID 1222. Since Asteroid ID 1222 had a higher IRAS match decision parameter, the sightings were associated with that asteroid.

Table 20. AK01.bin File Parameters

Variable	Origin	Description	Units
obsra	Computed in AKM	Equatorial RA earth-centered observed IRAS position. Computed from the IP01A parameter IPRA, the space-craft centered B1950 mean equatorial right ascension.	Radians
obsdec	Computed in AKM	Equatorial Dec earth-centered observed IRAS position. Computed from the IP01A parameter IPDec, the space-craft centered B1950 mean equatorial declination.	Radians
prdsqp	Computed in AKM	POSERR*RAS/XLNGT	Radians
Prdra	Computed in AKM	Equatorial RA earth-centered predicted IRAS position	Radians
prddc	Computed in AKM	Equatorial Dec earth-centered predicted IRAS position	Radians
prdang	Computed in AKM	Sum of Argument of Perihelion (angle) and True Anomaly used to form the Sun to asteroid vector in the orbital plane.	Radians
Prdflx[4]	Not sure	Predicted flux density (4 IRAS bands) (Values are hardwired to 0.0)	Jy

Longitude	Computed EQ2Gal.	Galactic Longitude Calculated from EQ2Gal() from RA and Dec in AK10.	Deg	F9.4
Latitude	Computed EQ2Gal.	Galactic Latitude Calculated from EQ2Gal() from RA and Dec in AK10.	Deg	F9.4

6 AK Processing Output File Formats For Missed Predicted Sightings

Tables 27 through 32 list the output formats associated with the Missed Predicted Sightings file.

Table 27. AK02.bin File Parameters

Variable	Origin	Description	Units
FMIST(4)	Hardwired	Predicted (expected) flux density (4 IRAS bands) This value is 0.0 for every record.	N/A
SGFMST(4)	Hardwired	Predicted (expected) flux uncertainty (4 IRAS bands) This value is 0.3 for every record.	N/A
LAMIST	IP03.bin	Lambda angle from center of sun to asteroid	
BETMST		Beta angle from center of sun to asteroid	
SGPMST	Hardwired	A sigma value for some sort of statistic. This value is 0.0 for every record.	
IDMIST	IP03.bin	Known Asteroid Number	N/A
TMIST	Computed	Time of Prediction (deciseconds since 1980.0)	Deciseconds
RASMST	Computed	Asteroid heliocentric distance, in the distance common block, when calculating the true anomaly, $RAS = A * (1.0 - ECCN * COS(ECAP))$ also, $RA1 = RAS / 149597870.0D0$	km
DELMST	Computed	Asteroid Distance to Earth.	km
ALFMST	Computed	Phase Angle	Radians
RADMST	Computed	Geocentric Distance	AU
ALBMST	IP03.bin	Bond Albedo	Unitless
XSCMST	Computed	Predicted X-Scan F/P Coordinate	Radians
HMIST	IP03.bin	Absolute visual magnitude.	Mag
GMIST	IP03.bin	Phase-coefficient-like parameter.	Unitless
SOPMST	IP01A	Spacecraft Operations Plan Number	N/A
OBSMST	IP01A	Observation Number	N/A
TYPMST	IP03.bin	Asteroid Type (always 1)	N/A

Table 28. AK09.txt File Parameters

Variable	Origin	Description	Units

7 AD Processing Output File Formats

Tables 33 through 37 list the output formats associated with the AD files.

Table 33. AD02.bin Parameters

Variable	Origin	Description	Units	Format
ADAlb	LBH Algorithm	Derived geometric albedo in each band	None	float(4)
ADSigA	LBH Algorithm	1-sigma uncertainties for ADAlb	None	float(4)
ADDiam	LBH Algorithm	Derived diameters (km) in each band	km	float(4)
ADSigD	LBH Algorithm	1-sigma uncertainties for ADDiam	None	float(4)
ADTNam	AK05	TNam for asteroid sighting described by this record	Deciseconds	long
ADID	AK05	Known asteroid number	None	Integer
ADStat	LBH Algorithm	Status words for albedo/diameter solutions in each band	None	Char*4
ADDNam	AK05	DNam for asteroid sighting described by this record. Called AstDet in AK05 (Predicted DETID).	None	byte
ADType	AK05	Object type code for asteroid described by this record. Called ObjTyp in AK05 (always set to 1).	None	byte

Table 34. AD06.bin Parameters

Variable	Origin	Description	Units	Format
LMAIb		albedo derived from B2 zody noise $AI = AK10Rec.AlbMst$ $AI = Ratio * AI$ (modified albedo) $AD06Rec.LMAIb = AI$;	None	Float
LMDiam		derived diameter, km Computed By: $AD06Rec.LMDiam = \exp((RR0 + RR1 * AK10Rec.HMst) * 2.3025851 + RR2 * \log(AI))$;	,Km	Float
LMTNam		Predicted Tnam $AD06Rec.LMTNam = AK10Rec.TMst$	None	Long
LMFlux	Computed	flux; B2 = zody noise, others from thermal Computed By: $Alfalfa = 57.2957795 * AK10Rec.AlfMst$; $PrdFlx()$		4 float
LMID		Object ID Number $AD06Rec.LMID = AK10Rec.IDMst$		Integer
LMType		Object Type code $AD06Rec.LMType = AK10Rec.TypMst$		Byte

Table 35. FP201A.bin Parameters

Variable	Origin	Description	Units	Format
PVMean	Computed	mean albedo	None	float
SigPVMean	Computed	1-sigma uncertainty in PVMean	None	float
DiaMean	Computed	mean diameter, km	km	float
SigDiaMean	Computed	1-sigma uncertainty in DiaMean, km Computed by: $FP01Rec.SigDiaMean = \text{abs}(FP01Rec.DiaMean - (\exp((RR0 + RR1*AK05Rec[1].H)*2.3025851 + RR2*\log(FP01Rec.PVMean + FP01Rec.SigPVMean))))$;	km	float
PVMedian	Computed	median albedo $FP01Rec.PVMedian = MedPV$;	None	float
SigPVMedian	Computed	1-sigma uncertainty in PVMedian $FP01Rec.SigPVMedian = SigMedPV$;	None	float
DiaMedian	Computed	median diameter, km $FP01Rec.DiaMedian = \exp((RR0 + RR1*AK05Rec[1].H)*2.3025851 + RR2*\log(FP01Rec.PVMedian))$;	km	float
SigDiaMedian	Computed	1-sigma uncertainty in DiaMedian, km $FP01Rec.SigDiaMedian = \text{abs}(FP01Rec.DiaMedian - (\exp((RR0 + RR1*AK05Rec[1].H)*2.3025851 + RR2*\log(FP01Rec.PVMedian + FP01Rec.SigPVMedian))))$;	km	float
ProbLtCurvEffect t	Computed	probability that the sightings used were affected by light-curve effects summed over Nsight: $ChiSq = ChiSq + \text{sqr}(GaussMeanPV - PVSightMean[I]) / (GaussVarPV + VarPVSightMean[I])$; Then: $FP01Rec.ProbLtCurvEffect = 2.0*PChiSquare(ChiSq, Sum1) - 1.0$; Truncated value: if $(FP01Rec.ProbLtCurvEffect < ProbLtCurvMin)$ $FP01Rec.ProbLtCurvEffect = ProbLtCurvMin$;	None	float
PopSigma	Computed	population sigma of used observations' albedos	None	float
MaxSNR	Computed	max SNR of used observations	None	float
MinSNR	Computed	min SNR of used observations	None	float
FluxVaRange	Computed	range of max/min flux variation in each band for sightings with Fstat > 2	None	array<1,4, float>
NUseSight	Computed	no. of usable sightings, any/all bands	None	long
NUseObs	Computed	(Number of observations used)	None	array<1,4, word>
NRejObs	Computed	no. of rejected observations in each band	None	array<1,4, word>

Table 36. AD07.txt Parameters

Variable	Origin	Description	Units	Format
LMID	AD06.bin	Object ID Number (was I*4 expanded for CSIMPS to I*8)	None	I 8
LMTYPE	AD06.bin	Object Type code Always = '1' (was I*1 expanded for CSIMPS to I*2)	None	I 2
LMTNam	AD06.bin	Predicted TName	Deciseconds	I 9
LMAIb	AD06.bin	albedo derived from B2 zody noise	None	F6.4
LMdiam	AD06.bin	derived diameter, km	km	F7.2
LMFlux[4]	AD06.bin	flux; B2 = zody noise, others from thermal model converted to Jansky	Jansky	4 F7.3
Nmiss	Computed	Number of missed sightings.	None	I 2
PstatW[32]	Computed	Prediction Status Word (not the same as the AK10.bin PstatW!)	None	I 32

Table 37. AD04.txt Parameters

Variable	Origin	Description	Units	Format
AstID	AK05.bin	Asteroid ID Number (was I4 expanded to I8 to accommodate larger Asteroid ID's)	None	I8
ObjType	AK05.bin	Object Type (was I1 now I2)	None	I2
AsTNam	AK05.bin	Predicted TName	None	I9
GaLat	Computed	converted from AK05 ObsRA and ObsDec	Deg	F8.4
EcLong	Computed	converted from AK05 ObsRA and ObsDec	Deg	F8.4
EcLat	Computed	converted from AK05 ObsRA and ObsDec	Deg	F8.4
R	AK05.bin	Heliocentric Distance in AU converted from PrdRAS in km $\text{Km2AU} = 1.0/1.4959787\text{e}8$;	AU	F6.3
Alfa	AK05.bin	Phase Angle Converted from PrdAlp to Deg	Deg	F7.2
Flux[4]	Computed	Flux Found from PrdFlx() subroutine IP03: D=Diameter, Al=Albedo, H=Visual Absolute Magnitude, G=Visual Slope Parameter R,Rho,Alpha from AK05 with conversions Converted to Jansky $\text{F2Jan}[1] = 1.0\text{e}14/13.48$; $\text{F2Jan}[2] = 1.0\text{e}14/5.16$; $\text{F2Jan}[3] = 1.0\text{e}14/2.58$; $\text{F2Jan}[4] = 1.0\text{e}14$;	Jansky	4 F7.3
AstFlux[4]	AK05.bin	Observed flux (array of 4 - each IRAS band) Converted to Jansky $\text{F2Jan}[1] = 1.0\text{e}14/13.48$; $\text{F2Jan}[2] = 1.0\text{e}14/5.16$; $\text{F2Jan}[3] = 1.0\text{e}14/2.58$; $\text{F2Jan}[4] = 1.0\text{e}14$;	Jansky	4 F7.3
AstSnr[4]	AK05.bin	Observed flux signal-to-noise-ratio array	None	4 F7.2
ADAIb[4]	AD02.bin	Derived Geometric Albedo	None	F6.4
ADDiam[4]	AD02.bin	Derived Diameter	km	F7.2
Tscore	AK05.bin	IRAS match decision parameter TScore = $0.1666667*(0.43429448*\log(\text{AK05Rec.Score}) - 3.0)$;	None	F5.3
PosDiff	Computed	$\text{PosDiff} = \text{Rad2Deg} * 3600 * \sqrt{(\text{AK05Rec.PrdrA} - \text{AK05Rec.ObsRA}) * \cos(\text{AK05Rec.PrdrDec}) + \text{AK05Rec.PrdrDec} - \text{AK05Rec.ObsDec})}$;	Deg	F7.1
Fstat[4]	AK05.bin	Found from GetFStat() subroutine Inputs the AK05Rec.AstFst Flux status word for observed fluxes	None	4 I1
AstatW	AK05.bin	Asteroid status word Additional processing by subroutine Bin32() Bin32(AK05Rec.AStatW) Note: Bits are printed in reverse order as of 5/9/2000. Now Reverse_Bin32(AK05Rec.AStatW)	None	I 32

8 Final Product (FP) Output File Formats

The FP202.txt file is part of the IMPS Albedos and Diameters Data Base. It lists the albedo and diameter average result for each asteroid which has at least two final accepted band observations used. In SIMPS, the order of variables and format of variables differs slightly from the documentation on p. 154 of the "IRAS Minor Planet Survey" Table 13 describing final product formats. In CSIMPS, the output was changed to match the order in that Table. The FP202.txt format is shown in Table 38.

Table 38. FP202.txt Parameters

Variable	Origin	Description	Units	Format
AstType	hardwire	"1"	None	I2
AstID		Asteroid number	None	I6
Name	<u>IP03</u>	Asteroid name or provisional designations	none	A16
H	<u>IP03</u>	absolute visual magnitude	Mag	F5.2
PVMean	<u>FP01</u>	mean albedo	None	F6.4
SigPVMean	<u>FP01</u>	1-sigma uncertainty in PVMean	None	F5.3
DiaMean	<u>FP01</u>	mean diameter, km	km	F7.2
SigDiaMean	<u>FP01</u>	1-sigma uncertainty in DiaMean, km	km	F6.1
ProbLtCurvEffect	<u>FP01</u>	probability that the sightings used were affected by light-curve effects	None	F4.2
NUseSight	<u>FP01</u>	no. of usable sightings, any/all bands (Number of sightings used)	None	I2
NObsBand	<u>FP01</u> *	(Number of observations used) NObsBand = 0; for(I = 1; I <= 4; I ++) NObsBand += FP01Rec.NuseObs[I];	None	I2
ShowRat	<u>FP01</u> *	(Fraction of predicted sightings) Where Nmissd is the total number of missed sightings (non-zero AK06 records from 75 down), ShowRat is: if ((FP01Rec.NuseSight + NMissed) > 0) ShowRat = (real)(FP01Rec.NuseSight)/(FP01Rec.NuseSight + Nmissd);else ShowRat = 0.0;	None	F4.2
Bin32(LA)	<u>AK05</u> *	Or'd accepted status word for all sightings where (AK05Rec.AStatW & 61440) != 0)	None	32 I1
Bin32(LR)	<u>AK05</u> *	Or'd accepted status word for all sightings where (AK05Rec.AStatW & 61440) == 0)	None	32 I1

The FP203.txt file is part of the the IMPS Singleton Data Base. It lists the albedo and diameter average result for each asteroid which has only a single accepted band observation (only one sighting and only one band from that sighting was used). In SIMPS, the order of variables and format of variables differs slightly from the documentation on p. 154 of the "IRAS Minor Planet Survey" Table 13 describing final product formats. In CSIMPS, the output was changed to match the order in that Table. The FP203.txt format is shown in Table 39.

Table 39. FP203.txt Parameters

Variable	Origin	Description	Units	Format
AstType	hardwire	"1"	None	I2
AstID	IP03.bin	Asteroid number	None	I6
Name	IP03.bin	Asteroid name or provisional designations	none	A16
H	IP03.bin	absolute visual magnitude	Mag	F5.2
PVMean	<u>FP01</u>	mean albedo	None	F6.4
SigPVMean	<u>FP01</u>	1-sigma uncertainty in PVMean	None	F5.3
DiaMean	<u>FP01</u>	mean diameter, km	km	F7.2
SigDiaMean	<u>FP01</u>	1-sigma uncertainty in DiaMean, km	km	F6.1
ProbltCurvEffect	<u>hardwire</u>	(hardwired to 0.0)	None	F4.2
NUseSight	<u>FP01</u>	no. of usable sightings, any/all bands (Number of sightings used)	None	I2
NobsBand	<u>FP01</u> *	(Number of observations used) NObsBand = 0; for(I = 1; I <= 4; I ++) NObsBand += FP01Rec.NuseObs[I];	None	I2
ShowRat	<u>FP01</u> *	(Fraction of prdicted sightings) Where Nmissd is the total number of missed sightings (non-zero AK06 records from 75 down), ShowRat is: if ((FP01Rec.NuseSight + NMissed) > 0) ShowRat = (real)(FP01Rec.NUseSight)/(FP01Rec.NUseSight + Nmissd);else ShowRat = 0.0;	None	F4.2
Bin32(LA)	<u>AK05</u> *	Or'd accepted status word for all sightings where (AK05Rec.AStatW & 61440) != 0)	None	32 I1
Bin32(LR)	<u>AK05</u> *	Or'd accepted status word for all sightings where (AK05Rec.AStatW & 61440) == 0)	None	32 I1

For each asteroid, the FP205.txt file (Table 40) lists the sum of all sightings matching various criteria. There is one record per asteroid.

Table 40. FP205.txt Parameters

Variable	Origin	Description
AstID	AK05.bin	Known Asteroid Number.
Nrej	AK05.bin	Number of rejected sightings.
NMCon	AK05.bin	Number of Weeks-confirmed Sightings (MCON) sightings (AstatW bit 5)
NPSC	AK05.bin	Number of IRAS Point Source Catalog Version 2 (PSC) matches (AstatW bit 9)
Nouter	AK05.bin	Number of outer slot only detections (AstatW)
NFSS	AK05.bin	Number of IRAS Faint Source Survey Version 2 (FSC) matches (AstatW bit 17)
Nserendip	AK05.bin	Number IRAS Serendipitous Survey Catalog (SSC) matches (AstatW bit 20)
N2Plus	AK05.bin	Number of 2+ sightings matches (AstatW bit 31)
NlowScore	AK05.bin	Number of low position-match score
NB2OnlyNSC	AK05.bin	Number of band-2-only (25 micron band) with flux status < 5
Nsingle	AD02.bin	Number of singletons with flux status < 5
NLz	AK05.bin	Number of cross-scan uncertainty > 5
NcolorBad	AK05.bin	Number of asteroid color test failures.
NCStat	AK05.bin	Number of confusion status failures.
NlowCorr	AK05.bin	Number of correlation coefficient failures.
NlowAlb	AD02.bin	Number of non-physically low albedos (<0.01)
NonConvgd	AD02.bin	Number of albedo solutions not converged.
Nchauve	AD02.bin	Number of albedos eliminated by Chauvenet's criterion.

IMPS Missed-Predictions Data Base (FP206). Summary of the always-missed asteroids; those asteroids which were predicted to have crossed the IRAS focal plane array but which were never detected. This file is documented in Table 17 "Format of IMPS Missed-Predictions Data Base (FP106)" of "The IRAS Minor Planet Survey" PL-TR-92-2049, Chapter 10, page 159. "The IRAS Minor Planet Survey" references the DiamLUB units are "mag," but in reverse engineering the software it looks like the units are really "km." Table 41 lists the format of the FP206.txt file.

Table 41. FP206.txt Parameters

Variable	Origin	Description	Units	Format
AstTyp	hardwire	hardwired to always be "1" Asteroid Type	None	I2
AstID	loop index	Asteroid ID number	None	I5
Name	AK10.bin	Asteroid Name or provisional designation(s)	None	A16
Nmiss	<u>AK06</u>	Number of missed predicted scans (the pointers counting backwards from 75 are the missed predictions.)	None	I2
HMst	AK10.bin	Absolute Visual Magnitude	Mag	f5.2
GMst	AK10.bin	Slope Parameter	None	f6.3
Alb	IP03.bin	Visual Albedo Estimate	None	f6.4
DiaMst	AK10.bin	Diameter Estimate	Km	f7.2
AlbGLB	<u>AD06</u>	Greatest Lower Albedo Limit (program finds the maximum AD06Rec.LMAIb for all sightings in AK06 for this asteroid.)	None	f6.4
DiamLUB	<u>AD06</u>	Least upper diameter limit (program finds the maximum AD06Rec.LMAIb for all sightings in AK06 for this asteroid, DiamLUB is the value corresponding to the sighting with the maximum LMAIb.)	KM	f7.2
OrdPStatW	AK10.bin	OR'd prediction status word	None	32 I1

IMPS Sightings Data Base A listing of accepted sightings (FP208). The sightings are collated by asteroid in ascending numerical order. Some additional processing and unit conversions are performed in Genfp108. Formatting was changed slightly in CSIMPS to have a blank space between fields.

IMPS Rejected Sightings Data Base (FP209). A listing of rejected sightings. The sightings are collated by asteroid in ascending numerical order. Some additional processing and unit conversions are performed in Genfp108. Formatting was changed slightly in CSIMPS to have a blank space between fields.

The format of the FP208 and FP209 files are shown in Tables 42 through 44.

Table 42. FP208A.txt and FP209A.txt Parameters

Variable	Origin	Description	Units	Format

The FP220A.txt file stores information about each asteroid (Table 45). The Asteroid ID is the record number. Records are numbered from 1 to the last Asteroid ID processed in Ranges.Dat. Can be any subset of asteroid numbers when run interactively. Basically a text version of the binary FP01A file. Formatting was changed slightly in CSIMPS to have a blank space between fields.

Table 45. FP220A.txt Parameters

Variable	Origin	Description	Units	Format
PVMean	FP01.bin	mean albedo	None	F6.4
SigPVMean	FP01.bin	1-sigma uncertainty in PVMean	None	F6.4
DiaMean	FP01.bin	mean diameter, km	km	F7.1
SigDiaMean	FP01.bin	1-sigma uncertainty in DiaMean, km	km	F6.1
PVMedian	FP01.bin	median albedo		F6.4
SigPVMedian	FP01.bin	1-sigma uncertainty in PVMedian		F6.4
DiaMedian	FP01.bin	median diameter, km	KM	F7.1
SigDiaMedian	FP01.bin	1-sigma uncertainty in DiaMedian, km	KM	F6.1
ProbltCurvEffect	FP01.bin	probability that the sightings used were affected by light-curve effects	None	F4.2
PopSigma	FP01.bin	population sigma of used observations' albedos		F6.4
MaxSNR	FP01.bin	max SNR of used observations		F6.1
MinSNR	FP01.bin	min SNR of used observations		F6.1
FluxVaRange	FP01.bin	range of max/min flux variation in each band for sightings with FStat > 2		4 F5.1
NUseSight	FP01.bin	no. of usable sightings, any/all bands (Number of sightings used)	None	I2
NRejSight	computed	Number of rejected sightings. Computed from the AK06 record for each asteroid: NSights = 0; I = 1; while (AK06Rec.RecPtr[I] > 0) { NSights = I; I += 1; } NrejSight = NSights - FP01Rec.NuseSight	None	I2
NMisses	computed	Number of missed sightings. Computed from the AK06 record for each asteroid: NMisses = 0; I = 75; while (AK06Rec.RecPtr[I] > 0) { NMisses += 1; I -= 1; }	None	I2
NUseObs	FP01.bin	Number of observations used.	None	4 I2
NRejObs	FP01.bin	Number of rejected observations in each band	None	4 I2
Asteroid ID	Loop index	Asteroid ID Number	None	I4

For every Asteroid ID in Ranges.Dat, the FP221A.txt file (Table 46) lists the Or'd accepted status word.

Table 46. FP221A.txt Parameters

Variable	Origin	Description	Units	Format
AstID	loop	Asteroid number	None	I5
Bin32(LA)	*AK05.bin	Or'd accepted status word for all sightings where (AK05Rec.AStatW & 61440) != 0)	None	32 I1

Appendix A: CSIMPS Albedos and Diameters Catalog (FP202.txt)

This catalog presents derived albedos and diameters, together with various other parameters useful for assessing their reliability, for all asteroids with multiple IRAS survey observations.

This catalog presents the averaged results for the numbered type 1 asteroids which have at least two final accepted band observations used. The results are collated by asteroid in ascending numerical order. Catalog entries include:

- Identification Number (ID)
- Name (or provisional designation if un-named)
- Absolute Magnitude (H) [Mag]
- Average Albedo (pH) [Unitless]
- 1-Sigma Uncertainty of the Average Albedo (sigma-ph) [Unitless]
- Average Diameter (D) [km]
- 1-Sigma Uncertainty of the Average Diameter (sigma-d) [km]
- The Probability that the results were influenced by Light Curve or Aspect Variations (PLC)
- Number of Sightings Used (US)
- Number of Values (Bands) Averaged (UO)
- Fraction of Predicted Sightings Observed (FOR)
- OR'd Asteroid Status Word (AstatW)

This catalog contains one record per asteroid. If an asteroid is not listed here, that means it does not have at least two accepted sightings. See the CSIMPS Singleton Catalog (FP203) for a list of asteroids which had only a single accepted sighting. In addition to albedos and diameters, this catalog contains the uncertainties in each of these values, due solely to the measured uncertainties in the IRAS photometry, together with various other parameters useful for assessing the reliability of the adopted values.

Appendix B: CSIMPS Missed-Predictions Catalog (FP206.txt)

This catalog presents a summary of those asteroids which were predicted to pass across the IRAS focal plane during survey mode, but which generated no accepted associations. The entries are collated by predicted asteroid in ascending numerical order. Entries include the asteroid number and the number of times it was predicted to be scanned but was missed. Also given is the derived greatest lower limit on the albedo and least upper limit on the diameter for each asteroid, plus the analogous OR'd AStatW status word, MPStatW.

This catalog presents parameters for all missed asteroid sightings in the CSIMPS for which the asteroid had no accepted sightings. Catalog entries include:

- ◆ Asteroid Identification Number (ID)
- ◆ Number of Missed Predicted Sightings (NM)
- ◆ Greatest Lower Bound Geometric Albedo (AlbGLB)
- ◆ Least Upper Bound Diameter [km] (DiamLUB)
- ◆ The 16-bit Missed PredictionStatus Word

The CSIMPS Missed-Prediction Status Word

Bit	Meaning
1	An asteroid association exists.
2	Accepted Sighting
3	Low Galactic Latitude (< 10 degrees)
4	Galactic Center Match
5	Dead 25 micron Detector
6	Noisy 25 micron Detector
7	Albedo Not Converged
8	Predicted Flux < 0.14 Jy
9	Some Sighting Accepted
10	Some Sighting Rejected
11	Spacecraft Operations Plan Number 599 or 600
12	Predicted Sighting Conflict
13	All Predictions In Last Spacecraft Operations Plans
14	Disconnected Association
15	IMPS Asteroid Prediction
16	Spare bit (always 0)

Appendix C: CSIMPS Reject Catalog (FP205.txt)

This catalog presents a summary of the number of rejected sightings for each asteroid and the possible reasons for rejection.

This catalog presents a summary of the number of rejected sightings for each asteroid and possible reasons for rejection. There is an entry for each Type 1 asteroid, tabulated by asteroid in ascending numerical order.

Catalog entries include:

- ◆ Asteroid Identification Number (ID)
- ◆ Number of Rejected Sightings (R)
- ◆ Number of Weeks-confirmed Sightings MCON (M)
- ◆ Number of Sightings Confused with Sources in the IRAS Point Source Catalog Version 2. (P)
- ◆ Number of Sightings which only passed over outer slots detectors. (O)
- ◆ Number of Sightings Confused with Sources in the IRAS Faint Source Survey Version 2 (F)
- ◆ Number of Sightings Confused with Sources in the IRAS Serendipitous Survey Catalog (S)
- ◆ Number of Times more than one source was associated with a single asteroid prediction. (I)
- ◆ Number of Sightings with Low Position Match Scores (L)
- ◆ Number of Sightings detected only at 25 micron with Flux Status less than 5, i.e, not fully seconds-confirmed (B)
- ◆ Number of Singletons with Flux Status less than 5 (Z)
- ◆ Number of Sightings with uniform cross-scan uncertainties above five arcminutes (U)
- ◆ Number of Times the Color Test Failed (C)
- ◆ Number of Sightings with Confusion Status Failures (Q)
- ◆ Number of Sightings in which at least one band had an unacceptable low detection correlation coefficient (D)
- ◆ Number of Rejected Sightings in which the low-albedo test failed in at least one band (A)
- ◆ Number of Rejected Sightings in which an albedo solution failed to converge in at least one band (N)
- ◆ Number of Rejected Sightings in which an albedo was rejected from the final average by the Chauvenet criterion in at least one band (E)

Appendix D: CSIMPS Singleton Catalog (FP203.txt)

This catalog presents derived albedos and diameters, together with various other parameters useful for assessing their reliability, for all asteroids which have only one accepted sighting in a single band.

This catalog presents the averaged results for the numbered type 1 asteroids which have only a single accepted sighting in one band. The results are collated by asteroid in ascending numerical order. Catalog entries include:

- Identification Number (ID)
- Name (or provisional designation if un-named)
- Absolute Magnitude (H) [Mag]
- Average Albedo (pH) [Unitless]
- 1-Sigma Uncertainty of the Average Albedo (sigma-ph) [Unitless]
- Average Diameter (D) [km]
- 1-Sigma Uncertainty of the Average Diameter (sigma-d) [km]
- The Probability that the results were influenced by Light Curve or Aspect Variations (PLC)
- Number of Sightings Used (US)
- Number of Values (Bands) Averaged (UO)
- Fraction of Predicted Sightings Observed (FOR)
- OR'd Asteroid Status Word (AstatW)

This catalog contains one record per asteroid. If an asteroid is not listed here, or in the CSIMPS Albedos and Diameters Catalog (FP202.txt), that means it has no accepted sightings. In addition to albedos and diameters, this catalog contains the uncertainties in each of these values, due solely to the measured uncertainties in the IRAS photometry, together with various other parameters useful for assessing the reliability of the adopted values.

Please note that for the current version of CSIMPS the PLC variable is set to 0.0 for all singleton asteroids.
